SECTION 01

Welcome to Wolfie

Wolfie — Moonlight Slots is a four-reel slot simulator you can put on any WordPress page with one shortcode. It's just for fun: play tokens only, with no purchases and no cash prizes.

Wolfie on a page: the Big Prize Run panel, the machine and the paytable.

At a glance

Shortcode	`[mbr_wolfie]` (or `[wolfie]`)
Settings screen	None needed. Add the shortcode and you're done.
Requirements	WordPress 6.3 or later · PHP 7.4 or later
Works with	Block editor, Classic editor, Elementor, widget areas, theme templates
What's stored	Only the player's own game state, in their own browser. Nothing on your server.
Network requests	None. Artwork is drawn in code and sound is synthesized live.
Updates	Automatic, one-click, from the Little Web Shack update feed (from 1.0.1)
Licence	GPLv2 or later. Free, no premium tier, no telemetry.

This guide covers installing the plugin, placing the game, the shortcode options, how the game plays, automatic updates, and what to check if something doesn't look right. The last section is a reference for developers.

SECTION 02

Installing the plugin

Requirements

- WordPress **6.3** or newer
- PHP **7.4** or newer (PHP 8.x recommended)
- Any modern browser for visitors: Chrome, Edge, Firefox or Safari from the last few years

Install from the ZIP

1. Download `mbr-wolfie-slots-1.0.1.zip`. Don't unzip it.
2. In your WordPress dashboard, go to **Plugins** → **Add New Plugin** and click **Upload Plugin**.
3. Choose the ZIP file and click **Install Now**.
4. When it finishes, click **Activate Plugin**.
5. Add the shortcode to a page (see Section 3).

Upgrading from 1.0.0

Version 1.0.0 didn't include the update checker, so this one upgrade has to be done by hand. After that, every future version arrives automatically.

1. Go to **Plugins** → **Add New Plugin** → **Upload Plugin** and upload the 1.0.1 ZIP.
2. WordPress notices the plugin is already installed. Click **Replace current with uploaded**.
3. That's it. Players' balances are kept, because they live in each visitor's browser, not in the plugin.

> **Good to know**
> Deactivating or deleting the plugin removes nothing from your database, because Wolfie never writes to it. There's no clean-up to do.

SECTION 03

Adding Wolfie to a page

Wolfie appears wherever you place the shortcode. Choose the method that matches how you build your pages.

Block editor (Gutenberg)

1. Open the page or post you want the game on.
2. Click the **+** block inserter and search for **Shortcode**.
3. Add the Shortcode block and type `[mbr_wolfie]`.
4. Publish or update the page, then view it. The editor shows the shortcode as text and the game appears on the live page.

Classic editor

Type `[mbr_wolfie]` on its own line, in either the Visual or the Text tab, then update the page.

Elementor

1. Edit the page with Elementor.
2. Drag a **Shortcode** widget into a section. For the best fit, use a full-width or wide container.
3. Enter `[mbr_wolfie]` and click **Update**.
4. The game runs in the editor preview too. If it looks unstyled the first time, save and reload the editor once.

Widget areas and theme templates

In a widget area, add a **Shortcode** block (or a Text widget) containing the shortcode. To place the game from a theme file, use:

```
<?php echo do_shortcode( '[mbr_wolfie]' ); ?>
```

Tip: give it room

Wolfie adapts to whatever space it's given (see Section 6), but it looks its best in a wide column. A full-width page template, or an Elementor section set to full width, shows the bonus panel and the paytable beside the machine.

One game per page

If you add the shortcode twice on the same page, the second copy shows a short notice ("Wolfie is already running on this page"). Both copies would share one balance and both would respond to the Space key.

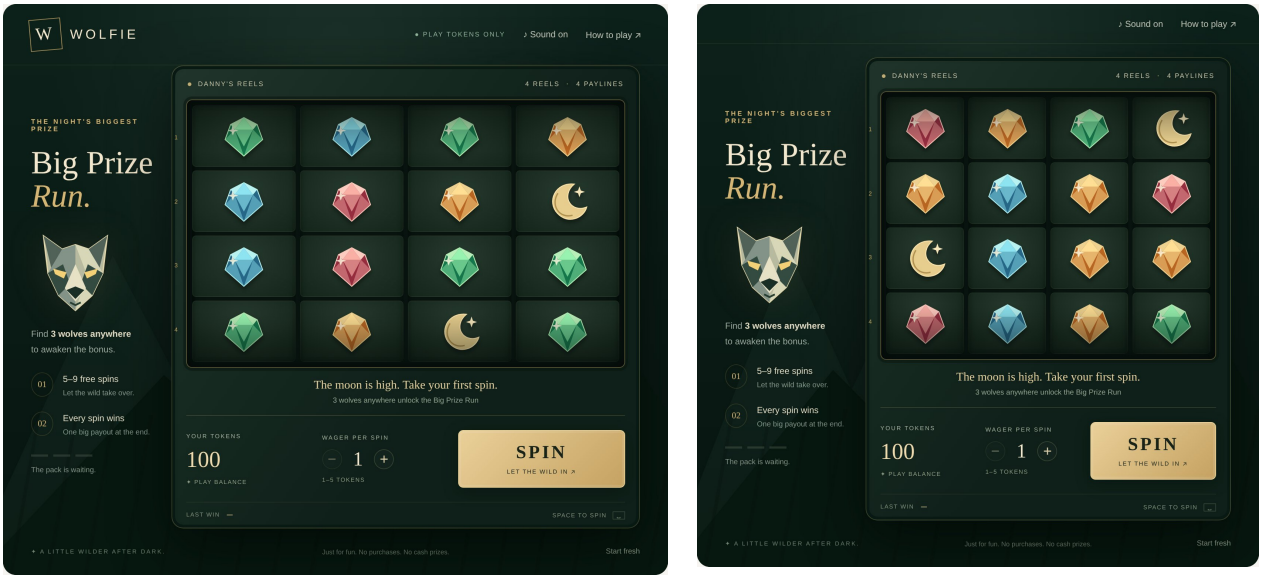

SECTION 04

Shortcode options

The shortcode works with no options at all. Two optional attributes let you slim it down to suit your page.

Shortcode	Result
`[mbr_wolfie]`	The full game: brand bar, WOLFIE title, bonus panel, machine and paytable.
`[mbr_wolfie intro="no"]`	Hides the large WOLFIE title block. Ideal when the page already has its own heading.
`[mbr_wolfie header="no"]`	Hides the brand bar. **Sound** and **How to play** stay, in a slim bar at the top.
`[mbr_wolfie intro="no" header="no"]`	The most compact version: just the game.
`[wolfie]`	A short alias for `[mbr_wolfie]`. It takes the same options. It's only available if no other plugin uses the name.

Attributes accept **yes** or **no**. **true/false**, **on/off** and **1/0** work too.

Left: [mbr_wolfie intro="no"] drops the title block. Right: intro="no" header="no" in a 760-pixel column.

SECTION 05

Playing Wolfie

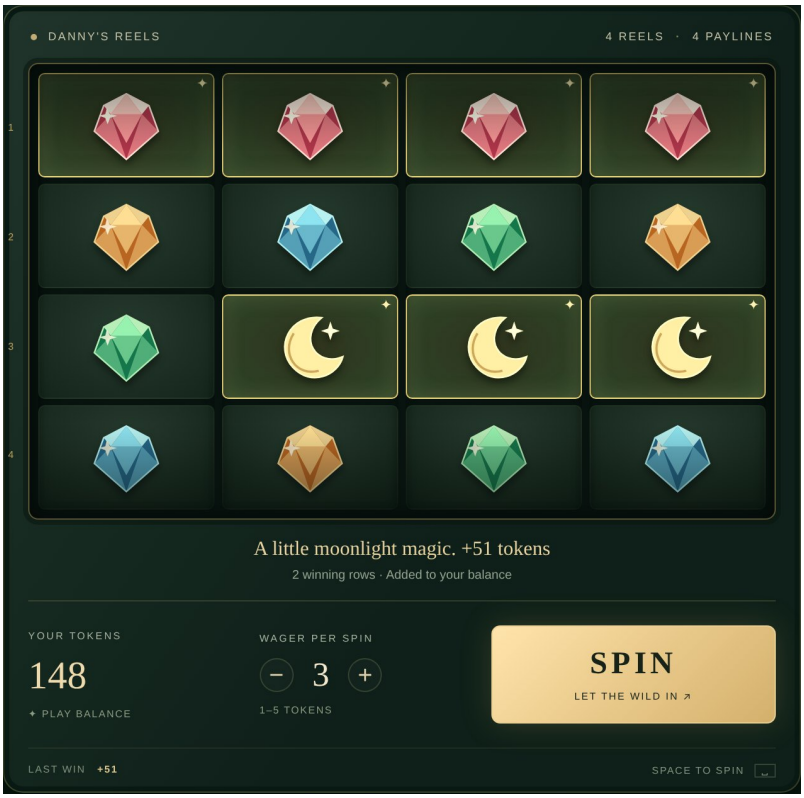

Everything a player needs is on screen, and the How to play button opens a full explanation. Here's the same information, so you can answer visitors' questions.

The basics

- Every player starts with **100 play tokens**.
- Choose a wager of **1 to 5 tokens** with the **−** and **+** buttons.
- Click **SPIN**, or click the machine once and press **Space**.
- Each wager covers **all four horizontal rows** (paylines), numbered 1 to 4 down the left of the reels.

How wins work

A row wins when **three identical symbols sit side by side**, starting from either edge: positions 1–3 or 2–4. **Four** identical symbols across the row pay the larger 4-symbol prize instead. Every winning row is added together. Prizes are multiplied by the wager.

Wager 3: four rubies on row 1 pay 12 × 3 = 36, and three moons on row 3 pay 5 × 3 = 15, for 51 tokens in total. Winning cells are outlined in gold.

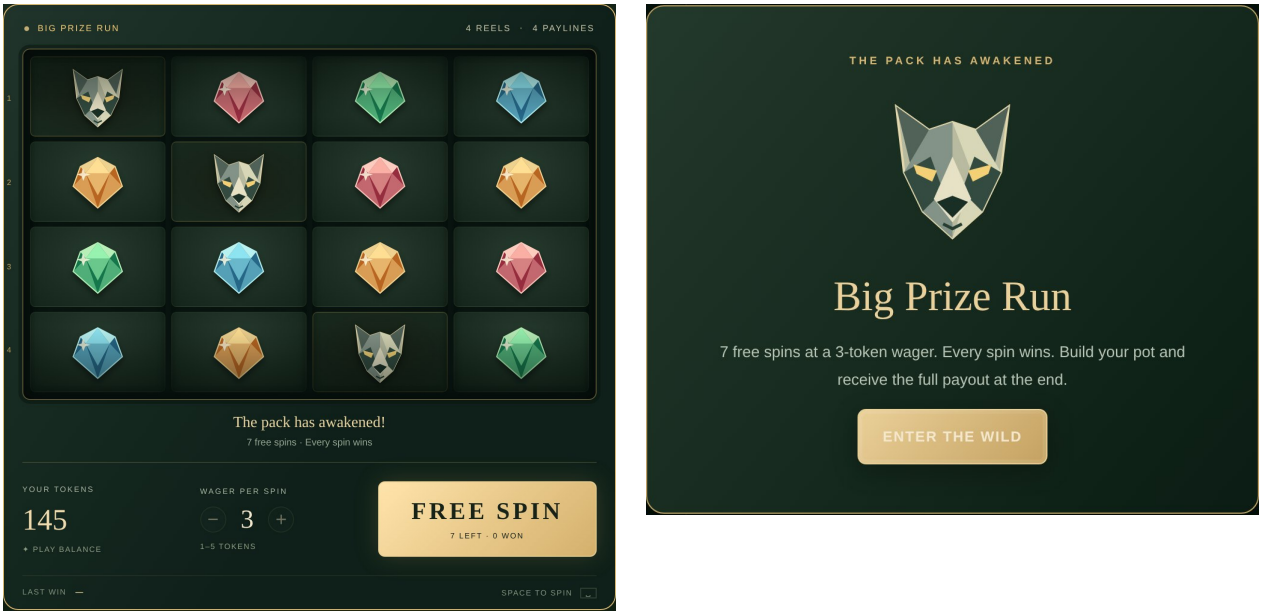

The paytable

Symbol	3 in a row	4 in a row	Chance per cell
Moon	5×	20×	10.5%
Ruby	3×	12×	17%
Sapphire	2×	8×	22%
Emerald	2×	6×	23%
Amber	1×	4×	25%
Wolf	Bonus scatter	Bonus scatter	2.5%

Each cell on the board is drawn independently. Wolves never form paying rows. They only count towards the bonus.

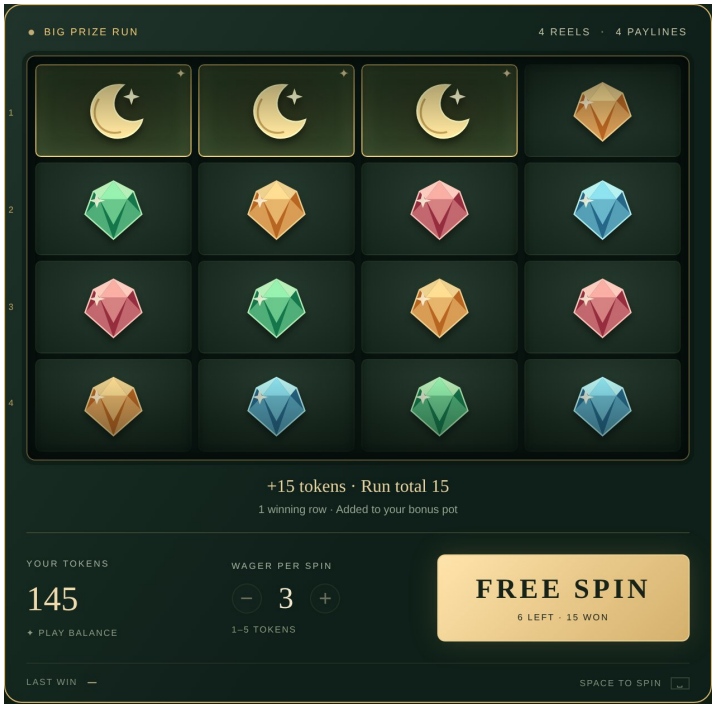

The Big Prize Run

Land **three or more wolves anywhere** on the board and the pack awakens. The scatter meter in the left panel lights up as each wolf lands, and every wolf howls.

Left: three wolves trigger the bonus. Right: the Big Prize Run announcement.

- The bonus gives **5 to 9 free spins**, chosen at random, at the wager that triggered it.
- **Every free spin wins.** If a bonus board happens to have no winning row, the game adds a matching three-symbol row.
- Winnings build up in a **bonus pot**, shown on the button (for example, *4 LEFT · 15 WON*), and the whole pot is added to the balance after the last free spin.
- Players press **FREE SPIN** at their own pace. The wager can't be changed during the run.
- Wolves don't retrigger the bonus during a run.

Mid-run: the machine shows BIG PRIZE RUN, and the button counts the spins left and the pot so far.

Saving progress

Balance, wager, sound setting and any unfinished bonus are saved automatically in the player's browser. Each result is saved *before* the reels animate, so closing the tab mid-spin never loses a win. An unfinished Big Prize Run is waiting when the player comes back.

- Progress belongs to that browser on that device. A different browser, a private window or clearing site data starts afresh.
- **Start fresh**, at the bottom of the game, resets to 100 tokens after a confirmation. It also clears any unfinished bonus.
- If the balance falls below the wager, the game suggests a smaller wager. At zero, it suggests Start fresh.

Sound and motion

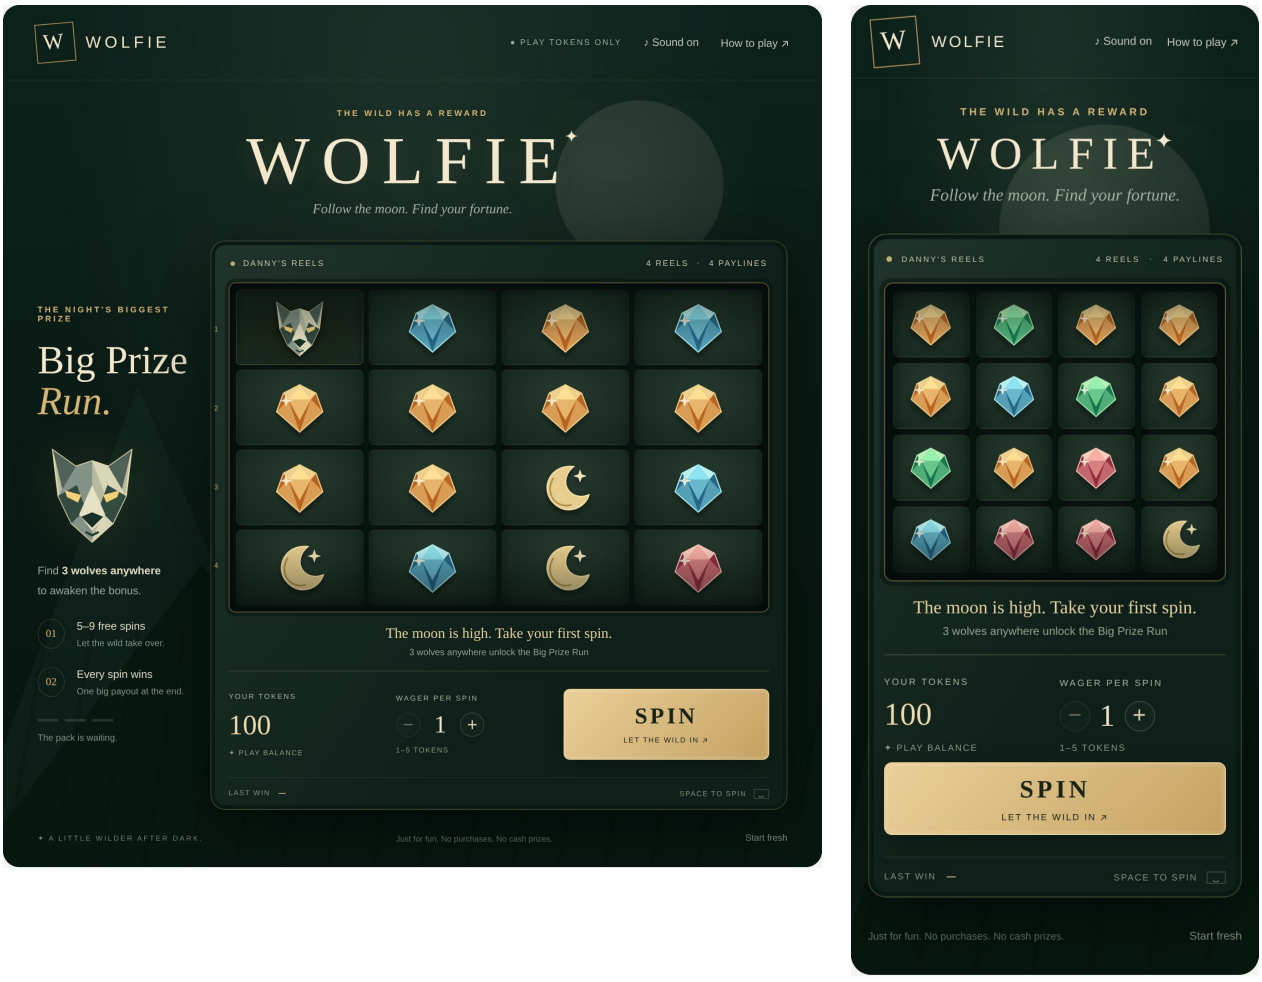

- All sound (howls, reel clicks, the cash-register payout) is **synthesized live**, so there are no audio files to download.
- Browsers only allow sound after the visitor has interacted with the page, so sound begins with the first click.
- ♪ **Sound on / off** in the top bar mutes the game. The choice is remembered.
- Visitors who have **reduced motion** switched on in their device settings see the results without the spinning animation.

SECTION 06

Wolfie on different screens

Wolfie measures the column it's placed in, not the browser window, so it fits a narrow sidebar column as well as a full-width page, whatever your theme.

Space available	Layout
Wider than 1100 px	Three columns: Big Prize Run panel · machine · paytable
700 to 1100 px	Two columns: Big Prize Run panel · machine. The paytable stays available under **How to play**.
Narrower than 700 px	One column: the machine fills the width. Phones get this layout.
Narrower than 420 px	Smaller symbols, and the SPIN button moves onto its own row for easy tapping.

Left: a 900-pixel content column (two columns). Right: a 390-pixel phone screen.

Your theme stays untouched

Wolfie's styling is sealed inside the game. It won't change your theme's buttons, headings or fonts, and your theme's styles (including Elementor Site Settings) won't distort the game.

SECTION 07

Automatic updates

From version 1.0.1, Wolfie updates itself like the rest of the MBR suite. There's nothing to set up.

How it works

- WordPress checks the Little Web Shack update feed in the background, using the bundled **Plugin Update Checker** library.
- When a new version is out, it appears in **Dashboard → Updates** and on the **Plugins** screen, with the usual **update now** link. Click it to install.
- Click **View details** to see the changelog before updating.
- To check straight away instead of waiting, use the **Check for updates** link under Wolfie on the Plugins screen.
- Automatic background updates work too, if you've enabled them for plugins in WordPress.

Changing or switching off the update feed

The feed address is held in a constant. Define it in `wp-config.php`, above the line that says *"That's all, stop editing!"*. Updating the plugin never overwrites wp-config, so your choice sticks.

```
// Use your own update feed:
define( 'MBR_WOLFIE_UPDATE_URL', 'https://example.com/feeds/mbr-wolfie-slots.json' );

// Or switch update checks off entirely:
define( 'MBR_WOLFIE_UPDATE_URL', '' );
```

The default feed is:

```
https://raw.githubusercontent.com/HarbourBob/mbr-updates/main/mbr-wolfie-slots.json
```

SECTION 08

Privacy and responsible play

Privacy

- Wolfie makes **no network requests**, sets **no cookies** and collects **no personal data**.
- The only thing stored is the player's game state (balance, wager, sound setting, unfinished bonus), kept in their own browser's local storage under the key `mbr_wolfie.v1`. It's never sent to your server or anyone else.
- Players can clear it with **Start fresh**, or by clearing their browser's site data.
- Because it's only storage the player creates by playing, it usually counts as part of the service they asked for, but always follow your own cookie and privacy policy.

Responsible play

Wolfie is a casual simulator. Tokens have **no cash value**, can't be bought, can't be withdrawn and can't be exchanged for anything. The game advertises no return-to-player figure. The footer says so on every screen: *"Just for fun. No purchases. No cash prizes."*

> **Your audience, your call**
> Even without real money, slot-style games may not suit every website or audience. Consider who visits your site before adding Wolfie, and add your own age guidance if it's appropriate.

SECTION 09

Troubleshooting

The game area is empty, or it doesn't respond.

This is usually a performance or caching plugin. If it **combines**, **delays** or **defers** JavaScript, exclude the Wolfie scripts (anything in `/wp-content/plugins/mbr-wolfie-slots/`). Delay JavaScript features hold scripts back until the visitor first scrolls or clicks. Then clear the page cache.

The game looks unstyled for a moment, or looks wrong.

Clear any page, CSS or CDN cache. If CSS is combined or minified, exclude `wolfie.css` and test again. The plugin loads its stylesheet in the page head whenever it can detect the shortcode.

Pressing Space scrolls the page instead of spinning.

Space only spins once the game has focus, so it can't hijack page scrolling. Click anywhere on the machine first, or use the SPIN button.

There's no sound.

Check that ♪ **Sound on** is showing in the top bar, that the device isn't muted, and that the page has been clicked at least once. Browsers block sound until the visitor interacts.

A player's balance went back to 100.

Progress is saved per browser. A different browser or device, a private window, or clearing site data starts a new game. Players should keep one Wolfie tab open at a time.

“Wolfie is already running on this page.”

The shortcode appears twice on that page, perhaps once in the content and once in a widget or template. Remove one copy.

The layout looks cramped.

The column is narrow. Use a full-width page template or a wider Elementor section, or add `intro="no"` to save height.

No update notice has appeared.

Click **Check for updates** under Wolfie on the Plugins screen. If nothing appears, make sure `MBR_WOLFIE_UPDATE_URL` isn't defined as empty in wp-config.php, and that your server can reach `raw.githubusercontent.com`. If you're still on 1.0.0, install 1.0.1 by hand once (Section 2).

SECTION 10

Developer reference

Constants

Constant	Purpose
`MBR_WOLFIE_VERSION`	The plugin version (1.0.1). Also used to cache-bust the assets.
`MBR_WOLFIE_UPDATE_URL`	The update feed URL. Define it in wp-config.php to override it, or as `''` to disable updates.
`MBR_WOLFIE_DIR` / `_URL`	The plugin's path and URL.

Filter: mbr_wolfie_load_assets

The CSS and JavaScript only load on pages that contain the game. The plugin checks the post content and Elementor's `_elementor_data` early, and falls back to enqueuing from the shortcode itself. Force it either way:

```
// Always load Wolfie's assets (e.g. when the shortcode is injected by AJAX):
add_filter( 'mbr_wolfie_load_assets', '__return_true' );
```

Asset handles

Handle	Type	File
`mbr-wolfie`	Style	assets/css/wolfie.css
`mbr-wolfie-engine`	Script (deferred, footer)	assets/js/engine.js
`mbr-wolfie-app`	Script (deferred, footer)	assets/js/app.js (depends on the engine)

Markup and styling

- The game renders inside `<div id="mbr-wolfie" class="mbr-wolfie">`. Every style is scoped under `#mbr-wolfie`, which outranks class-based theme and Elementor Kit rules.
- Layout breakpoints are CSS container queries (container name `wolfie`).
- JavaScript finds elements through `data-w` attributes inside the container, never global IDs.
- The accent colours are custom properties you can override, for example `#mbr-wolfie { --gold: #e0b060; }`

Game engine

`assets/js/engine.js` holds the pure game maths and exposes `window.WolfieEngine`. Under Node it's also available through `module.exports`, so it can be unit-tested without a browser.

Member	Description
`symbols`	The symbol list, with id, name, weight (percentage chance) and pay [3-match, 4-match]
`pick(rng)`	Draws one symbol id by weight
`generate(bonus, rng)`	Returns a 4×4 board (column-major). In bonus mode, a winning row is guaranteed.
`evaluate(board, bet)`	Returns `{ total, lines, wolves }`

SECTION 11

Changelog

1.0.1 · October 2026

- New: automatic updates through Plugin Update Checker 5.7 and the Little Web Shack feed. The `MBR_WOLFIE_UPDATE_URL` constant overrides or disables it.
- New: README.md and this user guide.
- No changes to gameplay, odds or saved balances.

1.0.0 · October 2026

- First release: the Wolfie Chrome extension (v1.0.3) rebuilt as a WordPress plugin, with the `[mbr_wolfie]` shortcode, theme isolation, container-query layout, focus-scoped Space-to-spin, conditional asset loading and Elementor support.

Made by Robert Palmer · madebyrobert.co.uk · littlewebshack.com
